Deliverable 1

Denis (Requirements)

Describes the problem to be solved, but the requirements to do so are
not very detailed yet. The explanation for the working between user, application, scanner
and database should be more in-depth.

Eric (Documentary and Sketches)

Only shows one possible path through the application menu and lacks documentation
so far. There is no testable implementation yet.

Deliverable 2

Eric (Design)

A barebone structure has been created for the UI, but it not yet uniform. A specific style
and layout should be enforced throughout the entire application, implemented through CSS.
Interactive elements should be made with Javascript, so it is easier to apply functions.

Denis (Database)

Also a barebone database. The specific design needs to be finished based on the implementation
of our code in the application. In the current form, it can not be run on a PWA, changes will be
needed to be made based on how we deploy the final application.
